Fast cutting of different isolation materials!

The machine can be used for cutting of 2000mm wide and 100mm thick isolation materials, either soft or harder, more dense material quality.

The requested size can be adjusted with an easily moveable stop block by hand. The stop block can be fixed at the adjusted position.

A knife what is sharpened to a polygonal form makes the cutting and it is fixed on a car what is running on a gear rack. The harmful dust what goes up to the air is minimal, thanks to the sharp knife what turns in heading.

It is very simply to handle the machine with the help of the obvious press buttons on the electric box. The upturnable table does a big service in case of cutting bigger pieces.

The short movie about the function of the machine is found at the following address: <http://www.okgep.hu/movies/isolith-vago.wmv>
